

SHAPED, CENTER-FILLED CONFECTIONERY PRODUCTS

ABSTRACT

The invention includes an edible confectionery product that has at least two parts. The first part is a base unit formed of a first confectionery and having a top, a bottom, and between five to twelve sides when viewed from above. The second part is a center inclusion formed of a second confectionery. The center inclusion is partially embedded in the base unit and extends above the top of the base unit. The center inclusion is set in, as viewed from the top, from any side of the base unit. The first confectionery has a different composition and preferably has a different texture than the second confectionery. In one preferred embodiment, a plurality of base units are shearably joined.
